Daily Field Report 2 - UT Thickness Survey - ATU-100 Rich Amine (Pre-MOC)

Scope and Responsibilities

Marcus Chen, acting as lead UT technician, performed a UT thickness survey on the rich amine circuit within the ATU-100. The scope of work involved the measurement of wall thickness for lines 6-RA-103 and 4-RA-104 to establish pre-MOC baseline data.

All activities were conducted under the direction of Larkhall NDE Services Inc. and in accordance with the requirements set forth by the Hamilton Plant.

Regulatory and Procedural Compliance

The survey was performed under QSCP-NDT-001 Rev 2, which governs the ultrasonic thickness measurement requirements for the ATU-100, including specific provisions for insulation removal and inspection ports as part of the CUI program.

Field operations were executed in compliance with the safety requirements detailed in LNDE-JSA-20140902-024 and under the authorization of QSCP-WP-2014-09180.

Instrumentation and Calibration

Thickness measurements were obtained using an Olympus 37DL PLUS 0611452. The instrument was calibrated using LNDE-CS-001, a 4-step carbon steel calibration block ranging from 0.100 to 0.400 in.

Verification of the equipment is documented in LNDE-CAL-2014-0655. All measurement techniques and instrument settings were applied in accordance with ASTM E797.

Inspection Results - 6-RA-103

UT thickness readings were taken on 6-RA-103, the rich amine header. This A106 Gr.B line has a nominal thickness of 10.97 mm and a retirement thickness (t-min) of 4.57 mm.

The measurements were performed to support the 3-year thickness interval required for rich amine service.

Inspection Results - 4-RA-104

UT thickness readings were taken on 4-RA-104, the L/R exchanger rich side. This A106 Gr.B line has a nominal thickness of 8.56 mm and a retirement thickness (t-min) of 3.81 mm.

The survey was completed for this line as part of the overall ATU-100 rich amine circuit assessment.
